Value Stream

Capture → focus → transformation

What to gather first, what this layer focuses on, and what a modeler or AI agent can produce from it.

Capture inputs

- Shared terms
- Typed references
- Cross-layer consistency

Metamodel Vocabulary

This guide helps non-technical people express this layer clearly.

Transformation outputs

- Stable naming
- Reference clarity
- Shared language

Metamodel Vocabulary Authoring Guide

Use this guide when you need to describe the **shared language** that keeps every Blueprint layer consistent: names, typed identifiers, shared reference meanings, ownership conventions, and other cross-layer vocabulary.

This guide is about the **common language behind all layers**, not about one business slice.

What belongs here

- shared vocabulary used across layers
- how important things are named consistently
- how references should stay unambiguous
- what kinds of identifiers or categories matter in business terms
- cross-layer ownership, tags, or version meanings where those shape authoring behavior

What does not belong here

- the full definition of a single business concept or process
- raw schema syntax explanations
- low-level validator mechanics unless they affect author meaning

Core things to capture

- the shared business terms that should be reused everywhere
- the important categories of things the Blueprint distinguishes
- how the same entity should be recognized across multiple guides
- what reference and naming consistency matters to authors
- what cross-layer metadata matters to understanding and reuse

Core relationships to capture

- shared term -> layers that reuse it
- identifier/reference pattern -> entity kind it represents
- ownership/version/tag convention -> content it governs
- vocabulary term -> potentially conflicting term to avoid

Modus operandi

Use this guide when the team needs a shared language:

1. identify terms that appear across many guides
2. align on one meaning for each term
3. distinguish terms that are often confused
4. explain how cross-layer references should stay consistent
5. capture ownership, versioning, or tagging conventions only as author-facing meaning

Prompt set

- what terms appear across multiple guides?
- what does each term mean in one sentence?
- what is often confused with it?
- how do we know two references point to the same thing?
- what naming or ownership conventions must stay stable?

Free-text intake template

- **Shared term or reference kind:**
- **Meaning:**
- **Used in which guides/layers:**
- **What it is often confused with:**
- **Consistency rule for authors:**
- **Ownership/version/tag notes (if relevant):**

Worked example

- **Shared term:** Leave Request
- **Meaning:** an employee's request for time away from work during a defined period
- **Used in:** concepts, story, interactions, rules, tests, roadmap
- **Often confused with:** leave balance, approved leave calendar entry
- **Consistency rule:** use the same name and same primary identity everywhere; do not rename it by screen label or local slang

How this becomes YAML

A technical modeler or AI agent can use this guidance to keep IDs, references, names, ownership, and version-related metadata consistent across the full Blueprint model.

Common mistakes

- inventing a different name for the same thing in every guide
- using reference language nobody outside the toolchain understands
- explaining low-level schema mechanics instead of shared author meaning
- treating cross-layer conventions as optional when they are needed for consistency
